

The Weasley Family Clock

The Modern Weasley Clock: Bridging Family Connectivity via IoT.

This project transforms the often intrusive nature of family location tracking into a playful and intuitive experience by bridging digital status updates with physical kinetic movement.

Main features:

- **Real-time Kinetic Location Tracking:** The clock translates digital location updates from family members into physical movement of clock hands via stepper motors.
- **Integrated Multimedia Messaging:** The system supports sending and playing back voice messages and visual greetings directly through the clock's hardware.
- **Event-Driven Smart Synchronization:** Utilizing Firebase Cloud Functions, the project automatically routes data and manages logic (such as hand assignment and message queuing) in real-time .
